Abstract: The study entitled, “Effectiveness of Nursing Health Care Provided to Patients of Laoag City Hospitals” aimed to describe and analyze the effectiveness of nursing health care provided to patients admitted in different hospitals of Laoag City.

This study was a descriptive research which intended to describe and analyze status of nursing health care provided to medical, surgical, pediatrics and obstetrical-gynecological patients of Laoag City Hospitals. It also determined the influence age, sex, civil status, and occupation to the effectiveness on the level of wellness of the respondents to deepen understanding of the subject.

It is found out that during the hospitalization days, medical, pediatric and ob-gyne patients garnered a high quality of nursing health care while surgical patients received very high quality level. Surgical and ob-gyne patients are provided with high effectiveness of nursing health care.

The qualities of nursing health care provided to the patients have significant relationship to the level of wellness among medical and pediatric patients. Also the control variables significantly influence the level of wellness of the respondents. It is recommended that there should be a yearly review of staffing patterns and strategies in the different wards so as to improve effectiveness of the nursing health care program in the hospitals of Laoag City.
